Extra-Broad Heavy Specimen Rhododendron

This year is the thirtieth anniversary of the Charles G. Curtis Company. During the past thirty years we have developed one of the most unusual nurseries in this country.

We cite as follows a few of our outstanding accomplishments in the nursery field:

- (1) We have developed the largest Hemlock nursery in the country.
- (2) We have a new method of classifying the Hemlock according to its uses. This we found necessary because of the many unusual tree variations in our nursery.
- (3) We have 30 acres of natural growth of Rhododendron maximum adjoining our cultivated nursery.
- (4) In no other place in the East do so many valuable ornamental trees, shrubs, wild flowers and ferns grow so thrifty as they do in this section.
- (5) All of our plants are northern grown and therefore particularly hardy in the most northerly part of the United States.

We urge you to visit us and see for yourself.

CANADA HEMLOCK

(Tsuga canadensis)

We consider our Hemlocks far above the ordinary as they have been developed from seedlings into particular tree types.

Recently we have had a booklet published entitled "The Hemlock". In this brochure we have described the many uses to which the hemlock can be put, the

proper methods of handling them and their various peculiarities. We also classify the Hemlock according to its uses as described on this page and to further aid you in ordering trees under this classification we give a chart with the approximate measurements for each size tree.

We will be pleased to forward a copy of this booklet to you if you have not already received one.

We list the Hemlocks in our nursery under three distinct

Naturalistic

types, namely: (1) Hedge (2) Naturalistic (3) Specimen.

The Hedge type of tree are those trees generally cylindrical in shape and unusually heavy near the top.

The Naturalistic type of tree are those that are symmetrical, well branched on all sides, open foliaged and a single leader.

The Specimen type is the very heaviest sheared tree that can be grown. It may have a double or single leader. This is a perfect tree.

FROM OUR COLLECTING FIELDS

Rhododendron maximum (Great Laurel)

Our Rhododendron maximum are grown under perfect conditions for their maximum development. Instead of digging them here and there throughout the country side as most collectors do, we grow ours on our own property.

For the past thirty years we have been developing our own method of growing Rhododendron maximum. This method consists of cutting back the old plants, cutting out brush and trees to let in the correct amount of light and then thinning out the newly sprouted plants, thereby root pruning those remaining. This produces a Rhododendron grown under semi-nursery conditions. We claim that plants thus produced are far superior to the average collected Rhododendron.

We list three grades of Rhododendron—Average, Specially Selected and Extra Heavy Specimens.

AVERAGE plants are symmetrical plants well furnished.

Specially Selected plants are those that might truthfully be called light specimens. They are plants well above the average.

EXTRA BROAD HEAVY SPECIMENS are the very best and heaviest plants that we have. They are as broad if not broader than they are high and furnished to the ground.

KALMIA LATIFOLIA

Our Kalmia latifolia is collected in open fields where they have had an opportunity to develop into bushy plants. We have an unusually large supply of Kalmia in all sizes and grades.

We have several new fields of short, thrifty plants, ranging in sizes from 1 to 3 feet. These are very bushy with a heavy ball of roots. They are exceptional values at the below prices.

Typical 3 Ft. Kalmia latifolia

AZALEA NUDIFLORA AND ROSEA

We list the Azalea nudiflora and rosea under the same head. This is due to the unusual similarity of these plants in their dormant state, and also the fact that they seem to have crossed in this section of the country. A mixture of these two species gives quite an extended period of bloom.

AZALEA nudiflora and rosea

HARDY FERNS

The ferns listed are dug in large Clumps with one to four clusters of fronds in a clump. They can be used for massing or planting separately, but give an especially fine effect planted with Rhododendron maximum or other evergreens. Any carload could contain 200 to 300 ferns without extra charge for transportation, as they could be packed between other plants, filling in vacant spaces.

HUMUS FOR PLANTING

Scientists have put their stamp of approval upon our humus. In a series of experiments they found that our product has a higher plant food content than any other commercialized humus or leafmold in general use in the East.

Many of our customers have suggested that we term this material as leaf mold instead of humus. They contend that the word humus is so universally used on inferior soils, that our product should be differentiated from them. It is truly a leaf mold.

We will be glad to send you a sample upon request.

WATER WORN STONES FOR GARDEN WALKS

These stones are a hard bluestone picked from the Delaware River bed. They have one flat surface worn smooth by water action.

Water worn stones are ideal for use in naturalistic work, in gardens or for borders of beds and pools.

Stones averaging:

12 inches square covering space\$.15 each 18 inches square covering space31 each

These stones are irregular in shape and therefore cannot be scaled to the inch.

Write for prices on larger sizes.

Our water-worn stones used in garden steps on the estate of Paul Cravath, Locust Valley, N.Y. Morse and Morse, Landscape Contractors.

SHIPPING

By Railroad: We are located on the main line of the Erie Railroad from New York to Chicago. This road has fine facilities for transportation to all points East and West.

The following carload rates have been given to us by the Erie Railroad Company subject to change. This is based on a minimum carload weight of 16,000 lbs:

Southampton, N. Y \$73.60	Washington, D. C\$76.80
Pittsburgh, Pa 83.20	
Chicago, Ill	
Cleveland, Ohio 81.60

GENERAL INFORMATION

PLANTING:

Rhododendrons, Kalmia, Azaleas and Hemlock are easily grown if you follow a few very simple directions for planting. These are as follows:

- (1) Plant in a soil with plenty of drainage. Break up heavy subsoil if it is near the surface.
- (2) Never plant more than 1 inch deeper than they formerly grew.
- (3) Use a large quantity of leaf mold or humus in the hole in direct contact with the roots.
- (4) When covering leave a depression around the base of the plant instead of a mound of soil. This will carry surface water directly to the roots.
- (5) Use a mulch of leaves or sawdust on the surface around the plant. This is particularly important in Fall planting.
- (6) Use water frequently throughout the first year—preferably soft water.
- (7) Rhododendron maximum should never be planted in a sunny location or where they are exposed to strong winds.
- (8) Be sure your soil is acid. Do not plant in lime soil without special treatment.

PACKING:

The packing is done by experienced men. The floor of the car is first covered with a thick layer of moist sawdust. When decking is used the poles are covered with burlap and then with sphagnum moss. Sphagnum moss and burlap are also used around the doors to keep out the drying winds. The plants are packed tightly on the sawdust and moss and thoroughly drenched with water. Cordwooding or laying the plants down is done if the customer so desires. This is done with care and moss is used liberally between the layers.

Packing is done at cost for less than carload lots.

BURLAPPING:

There is an extra charge of 10 cents to 25 cents per plant for burlapping where it is not designated.

SHIPMENTS:

When ordering please state plainly whether the order is to be sent by freight or express. If this information is not given we will use our best judgment without assuming any responsibility for delivery.

PRICES:

Prices are for carload lots F. O. B. shipping point.

LOCATION OF NURSERIES

Callicoon is located in the upper valley of the Delaware River, along the border of the states of New York and Pennsylvania and on the main line of the Erie Railroad.

Our two nurseries are situated one and one-half miles from the Erie Station. The offices are located in the village of Callicoon about one-half block from the station.

Our nurseries of 200 acres are always open to inspection. The Spring season opens in March or April as soon as the frost is out of the ground and continues until the plants become too far advanced for safe handling. The Fall season extends from late August until the ground becomes frozen. We welcome you to come and select your plants and particularly to see how we raise the best Rhododendron maximum and Kalmia latifolia.

MAP SHOWING LOCATION OF NURSERIES
